1

Overview

What is vi?

Overview

- ◇ **vi** is a default **text editor integrated** in Linux systems
- ◇ It is the most popular and classic text editor in the **Linux family**.
- ◇ It is **user friendly** and available in almost all linux distributions
- ◇ There are other editors such as: **vim, nano, emacs** that can be used for **file modification**

NB: **vim** is an updated version of **vi**

A series of hexagonal icons in various shades of blue and cyan are arranged along the left edge of the slide. The icons include a lightbulb, a thumbs-up, a network diagram, a smartphone, a magnifying glass, a gear, and a speech bubble. The central hexagon is the largest and contains the number '2'.

2

Getting started with the vi editor

Open and edit a file

Important Note!

Before starting:

- ◇ Launch your **Visual studio code**,
- ◇ Open a **terminal** or use the one that is opened
- ◇ Check the VMs on your computer: **vagrant global-status**
- ◇ Copy the **ID** of a **Centos 7 server**. If you don't have one, **please install it now**
- ◇ Resume or start a **Centos 7 server**: **vagrant resume ID** or **vagrant up** (this works just fine)
- ◇ Connect remotely to a **Centos 7 server**: **vagrant ssh ID**

Starting the vi editor

- ◇ To open edit a file with **vi**, we use the command: **vi fileName**
- ◇ If the file indicated exists, it will be opened for edition
- ◇ If the file does not exist, the **vi** command will create an empty file with the name provided automatically and open it.
- ◇ **Example:** Let's create and open a new file in our current directory called **viclass**: **# vi viclass**

VI modes

Starting with vi

- ◇ In vi, we basically have two modes: the **command** and the **insert** mode
- ◇ In the **Command mode**, whatever you type is interpreted as a **command** not as a text

NB: vi always starts in the command mode.

- ◇ In the **Insert mode**, whatever you type is interpreted as an **input** and placed in the file.
- ◇ To edit the file, you must go to the **insert mode** by pressing the key "**i**".
- ◇ To come out of the insert mode, press the **Esc** key, which will take you back to the command mode.

If at some point, you are not sure which mode you are in, press the **Esc key twice**. This will take you to the command mode.

The ~ in the vi editor shows **unused lines**.

Starting with vi

- ◇ To **insert** some content in **viclass**, we need to switch to the **INSERT mode** by pressing the key " **i** " on the keyboard. (verify the last line of the page)
- ◇ Now we can **write** some text in our file just by typing with the keyboard
- ◇ To **save the modification** we press **ESC** (Escape key).
- ◇ To **quit** the **vi** interface, type **:wq**
- ◇ You can **# cat viclass** to view the content you have entered in the file

Let's go back to the vi interface to learn something new! **# vi viclass**

Starting with vi

- ◇ In **vi**, we use the **arrow keys** (up, down, left, right) to move from one line or from one word to the other. **The mouse does not work here!**
 - ◇ If you make a change that you don't want to save, you can **escape without saving**.
 - ◇ To do that, we press **ESC**, type **:q** and hit **Enter**
 - ◇ When you do that, you might encounter an **override problem** (at the end of the page) as shown in the following line
- ```
E37: No write since last change (add ! to override)
```
- ◇ To solve that problem, type **:q!** (this allows you to exit without saving)

# Starting with vi

- ◇ There are other useful tools in **vi** such as **[[** and **]]** (open and closed square brackets)
- ◇ **[[** takes you at the beginning of the file while **]]** takes you at its end.
- ◇ This is very useful when dealing with big files (as the file **secure** we used in the previous lesson)
- ◇ Let's quit **vi**, clear the screen and do some practice on a big file!

# Starting with vi

- ◇ To do that let's redirect the content of the file **secure** to **viclass**
  - **# cat /var/log/secure > viclass**
  - **# cat viclass** (to view the content of **viclass**) Good!
- ◇ Open the file in **vi** now, and play around with **[[** and **]]** to move to the beginning or to go to the end of this huge file.

# Starting with vi

- ◇ While scrolling into the file, you can press **O** key to get a new line on which you can write something.
- ◇ You can also press **Enter** to create some space between the lines
- ◇ To **delete a line of the file**, you can use **dd** (just press the **d** key twice).
- ◇ **NB:** You must be in the **command mode** to do that. If you are in the **INSERT mode**, pressing **dd** will just add the string **dd** to your file!
- ◇ If you make a mistake while typing, you can undo what you changed by pressing **u** key

# Starting with vi

Let's summarize some tips we have learned so far:

| Keys          | Functions                                 |
|---------------|-------------------------------------------|
| i             | Takes you to the INSERT mode              |
| ESC and a key | Bring you back to the Command mode        |
| o             | Takes you to the next line in INSERT mode |
| u             | undo the previous changes                 |
| dd            | delete a line in the Command mode         |

# Starting with vi

We also have:

| Keys                            | Functions                            |
|---------------------------------|--------------------------------------|
| arrow keys (up down left right) | Move in the vi interface             |
| ESC and :wq                     | Save and quit                        |
| ESC and :q                      | Quit without saving changes          |
| :q!                             | Escape the override problem          |
| [[ and ]]                       | move to the beginning and at the end |

3

# Useful keys in vi

Must be used in the **command mode**

# Other Useful keys in vi

| Keys       | Functions                                                                           |
|------------|-------------------------------------------------------------------------------------|
| <b>Esc</b> | Allows you to toggle between insert and command mode                                |
| <b>i</b>   | Takes you to the beginning of the line and insert mode (inserts text before cursor) |
| <b>a</b>   | Appends text after cursor                                                           |
| <b>A</b>   | Takes you to the end of the line and in insert mode.                                |
| <b>O</b>   | Adds new line above previous line (takes you to previous line in insert mode)       |
| <b>o</b>   | Adds new line below previous line (takes you to next line in insert mode)           |

# Other Useful keys in vi

| Keys     | Functions                                                                     |
|----------|-------------------------------------------------------------------------------|
| <b>h</b> | Moves left                                                                    |
| <b>j</b> | Moves down                                                                    |
| <b>k</b> | Moves up                                                                      |
| <b>l</b> | Moves to right                                                                |
| <b>w</b> | Moves to next word                                                            |
| <b>W</b> | Moves to next blank delimited word (just to next word after each blank space) |
| <b>e</b> | Moves to end of word                                                          |
| <b>E</b> | Moves to blank delimited word                                                 |

# Other Useful keys in vi

| Keys | Functions                                |
|------|------------------------------------------|
| (    | Moves sentence back                      |
| )    | Moves sentence forward                   |
| [[   | Moves to the beginning of document (top) |
| ]]   | Moves to very end of document (bottom)   |
| gg   | Moves to top first word of document      |
| G    | Moves to bottom first word of document   |
| x    | To delete character                      |
| n    | To skip to the next word                 |

# Other Useful keys in vi

| Keys                                 | Functions                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------|
| <b>r(character)</b>                  | Replaces a character (example. <code>rs</code> replaces original character with s)         |
| <b>:x</b>                            | To exit and save                                                                           |
| <b>:wq!</b>                          | To exit and save                                                                           |
| <b>dd</b>                            | Removes entire line (10dd would delete 10 lines from where u r down)                       |
| <b>:q</b>                            | To exit without saving                                                                     |
| <b>u</b>                             | To undo the last operation                                                                 |
| <b>/(word you are searching for)</b> | To search a word/string (example. <code>/root</code> will search for root throughout file) |

“ Don't try to memorize all of this!

*Just Practise and understand ”*

See you guys in the next lesson!

# Thanks!
